

Aspiration system design

Giovanni Beggio
giovanni.beggio@phd.unipd.it

In **AIR POLLUTION CONTROL SYSTEMS**
ENGINEERS must solve **1 CRUCIAL PROBLEM**

The polluted air must be moved:

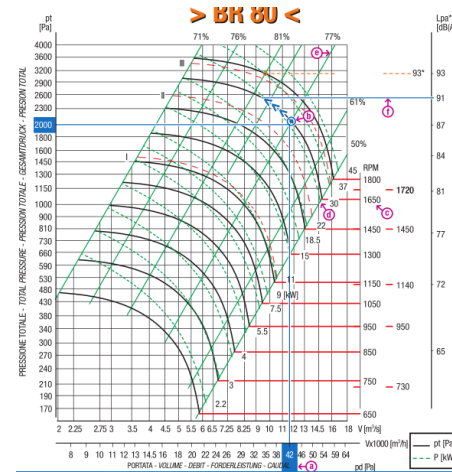

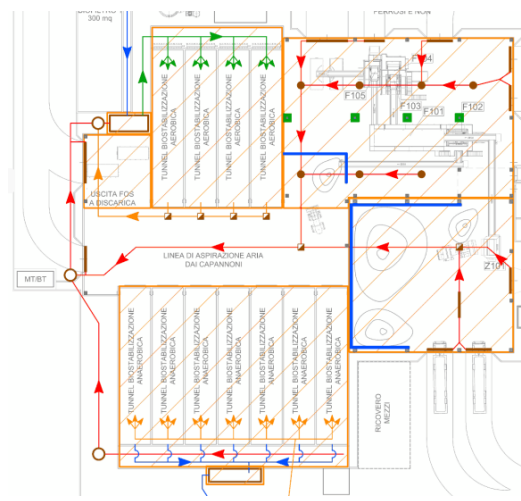

- from the source point in the plant to the FAN;
- from the FAN to the Air Pollution Control Device and to the stack;
- meeting **PERFORMANCE STDs** (velocity, noise, **costs**).

ASPIRATION / VENTILATION SYSTEM

DESIGN OF THE VENTILATION SYSTEM

- 1. Determination of the features of the airflow rate Q (Nm^3/h) to be conveyed to the APCD (air volume changes per hour for buildings, involved industrial process and contaminants, ..)**
- 2. Design the proper duct system (arranging the flow pattern in the space to be served, dimensioning, selection of proper materials and auxiliary components, ...)**
- 3. Selection of the proper FAN (fan components, material, fan curves, needed static pressure,..)**

COMPONENTS OF THE VENTILATION SYSTEM

DUCTS

FAN

AUXILIARY
EQUIPMENT

DUCTS

Design Criteria

$$D = \sqrt{\frac{4Q}{\pi V}}$$

Where:

- **D** = Duct **INNER** diameter (m)
- **Q** = Flowrate to be treated (m³/h)
- **V** = Design velocity (m/s)

!!! 10 m/s < V < 20 m/s !!!

**DUST DEPOSITION
NOISE (dB)
HEAD LOSSES**

DUCTS

Construction Materials (1/3)**Galvanized Steel**

- Carbon Steel after a Zinc bath
- Medium-Low Resistance to Corrosion
- Medium-Low Construction Cost , High Maintenance Cost
- Low-Medium Temperature ($< 100^{\circ}\text{C}$)

AISI 304

- Stainless Steel (18% Cr, 9% Ni)
- Medium-High Resistance to Corrosion
- Medium-High Cost, Low Maintenance Cost
- Medium-High Temperature

AISI 316

- Stainless Steel (17% Cr, 11% Ni, 2,5% Mo)
- Very High Resistance to Corrosion
- Very High Cost
- Medium - Very high Temperature

DUCTS

Construction Materials (2/3)**Polypropilene
(PP)**

- Plastic Polymer + additives
- High Resistance to Corrosion
- Medium Construction Cost , Medium Maintenance Cost
- Antistatic and Self-extinguishing
- Low temperature (< 100 °C)

Aluminum

- Buildings ventilation..

DUCTS

Construction Materials (3/3) Selection Criteria

1) AIRFLOW TEMPERATURE

Full knowledge of
the industrial
processes involved

2) AIRFLOW CONTAMINANTS

Humidity
H₂S , NH₃, Amines
Acid Gases (HCl, ..)
Explosive gases (CH₄,
biogas, ATEX)
Dust

3) ECONOMIC SUSTAINABILITY

Beware of the
higher than
necessary costs!

!BRAND NEW DESIGN vs. PROJECT LEGAL REQUIREMENTS!

DUCTS

**Calandered
Duct**

- Longitudinal Junctions**
«Aggraffatura» a.k.a. Longitudinal welding
- Steel Sheet of variable height ($H \leq 1,5$ m)
 - Straight Longitudinal Junction
 - Length of components is determined by the steel sheet height
 - https://www.youtube.com/watch?v=Fdi0O_tuCbo&t=38s

**Spiroidal
Duct**

- Steel «Stripe» of fixed height
- Spiroidal Longitudinal Junction
- Length of components is determined by the functioning duct manufacturing machine
- https://www.youtube.com/watch?v=OLVdX0lgUUE&t=34s&index=4&list=LLLvWlv_MznK9GliPyelzjSA

DUCTS

Spigot Junctions

- Low hydraulic leakproofness
- Low cost
- Gaskets

Flanged Junctions

- High hydraulic leakproofness
- High cost
- Gaskets

Cross Junctions

DUCTS – AUXILIARY EQUIPMENT

1. **ANTIVIBRANT FITTINGS** = flexible fittings that reduce the propagation of mechanical and / or acoustic vibrations and the expansion between two components
2. **DAMPERS** = elements inserted in the air ducts or installed on the terminals of these to allow the control in the flow rate or the complete interruption of the air flow (Automatic or manual Butterfly valve, Guillotine damper, ...)
3. **MEASUREMENT DEVICES** = Temperature, Flowrate, Pressure measurement inside ducts
4. **COLLARS and WALL BRACKETS** = components to fix the ventilation/aspiration system to the building walls

FANS

«THE HEARTH OF A VENTILATION SYSTEM»

➔ Provide energy needed to convey the flue gases from the emission source to the APCD;

➔ Energy is provided in terms of pressure (mmH₂O)

➔ Design Pressure Value must be enough to overcome the pressure losses due to the ventilation system and the APCDs

FANS – TYPES

CENTRIFUGAL FLOW FANS

Air enters in the eye of the rotor, turns at right angles, and is accelerated and compressed (the pressure rises) by centrifugal force into the discharge. Propeller movement converts centrifugal force to pressure rise

AXIAL FLOW FANS

Air flows straight through the device along the axis of rotation. Propeller movement converts centrifugal force to pressure rise. Air is pulled in on the leading edge and discharged from the trailing edge.

Generally **APC applications involve Centrifugal Fans** because of their stable and efficient operation through times (less maintenance during continuous functioning)

Axial flow Fans are instead used in Buildings Ventilation Systems

FANS – PRINCIPAL COMPONENTS & MATERIALS

PROPELLER

CASING

ELECTRICAL ENGINE + INVERTER

SOUNDPROOFING BOX

MATERIALS

Polipropilene

Galvanized Carbon Steel

AISI 304

AISI316

SPECIAL COATINGS

FANS – TECHNICAL FEATURES (1/2)

DEFINITIONS

FAN provides ENERGY in terms of TOTAL PRESSURE (pt), which is the sum of 2 contributions $pt = ps + pd$

- **Static pressure (ps)** = It is defined as the **pressure exerted by the fluid on the walls of the pipe** or vessel in which it is contained. It acts equally in all directions and is **independent of the velocity of the fluid**. Taking the ambient pressure as a reference, the static pressure is positive when it is greater than the ambient pressure, negative when it is less;
- **Dynamic pressure (pd)** = It is defined as the **pressure corresponding to the part of energy possessed by the mass unit of the fluid because of its velocity (kinetic energy)**. It acts in the same direction as the fluid motion and is always considered positive (it acts in the direction of the fluid).

$$pd = \frac{1}{2} \cdot \rho \cdot v^2$$

- pd = dynamic pressure (Pa)
- ρ = flue gas density (kg/m³)
- V = flue gas velocity (m/s)

FANS – TECHNICAL FEATURES (2/2)

FAN CURVES

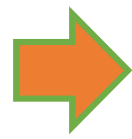

Fan curves summarize **the performance of each fan model**, by presenting quantitative **RELATIONSHIPS** between

- Flowrate (X axis)
- Static pressure delivered (left Y axis)
- Adsorbed Power (in red)
- Mechanical Efficiency (in blue)
- RPM (Revolutions per Minute)

HOW TO CHOOSE THE RIGHT FAN?

1. Flowrate features
 - Q
 - Contaminants concentrations
 - Temperature
 - Density
2. Static pressure (P_s) to provide to the system

$$P_s \geq \sum \Delta P_i$$

- $\sum \Delta P_i$ = sum of system head losses

HEAD LOSSES IN AIR DUCTS

Head losses are **pressure drops** (with irreversible transformations of mechanical energy into heat) **caused by friction forces and turbulences** acting countercurrent to the motion of a fluid through a duct.

1. **Continuos** = pressure losses caused by **friction in straight lengths** of duct
2. **Localized** = pressure losses caused by both **friction and turbulence** in duct system «singularities» (e.g. bends, fittings, expansion or contraction, etc.)

unità di misura	Pa	mm H ₂ O (kgf/m ²)	torr (mm Hg)	bar	mmlbar	inwg

Continuous head losses 

Localized head losses 

CONTINUOUS HEAD LOSSES

$$r = \frac{F_a * \rho * v^2}{2D}$$

$$\rho = 1,293 * \frac{P_b}{1,013} * \frac{273}{273+t} \quad v = \frac{1,5}{\rho} * 10^{-6} * \left(\frac{273+t}{413+t}\right)^{1,5}$$

$$P_b = -0,1125 * H + 1.011,5$$

- r = length specific pressure losses (Pa/m)
- ρ = flue gas density (kg/m³)
- ν = flue gas cinematic viscosity (m²/s)
- v = flue gas velocity (m/s)
- D = inner duct diameter (m)
- P_b = Barometric pressure (mbar)
- H = altitude (m)
- **F_a = friction factor (dimensionless)**
- Re = Reynolds number (dimensionless)

$$F_a = f(Re)$$

$$Re = \frac{v * D}{\nu}$$

- **LAMINAR FLOW** → $Re < 2.000$
- **TURBULENT FLOW** → $Re > 2.500$

APC DUCT SYSTEM → TURBULENT FLOW!

CONTINUOUS HEAD LOSSES – TURBULENT FLOW

$$\text{Colebrook} \quad \frac{1}{F_a^{0,5}} = -2 \log_{10} \left(\frac{\varepsilon}{3,7 * D} + \frac{2,51}{Re * F_a^{0,5}} \right) \rightarrow \text{Altshal \& Tsal} \quad F_a^* = 0,11 * \left(\frac{\varepsilon}{D} + 192,3 * \frac{D * v}{G} \right)^{0,25}$$

$$r = 6,254 * 10^7 * F_a * \rho * \frac{G^2}{D^5}$$

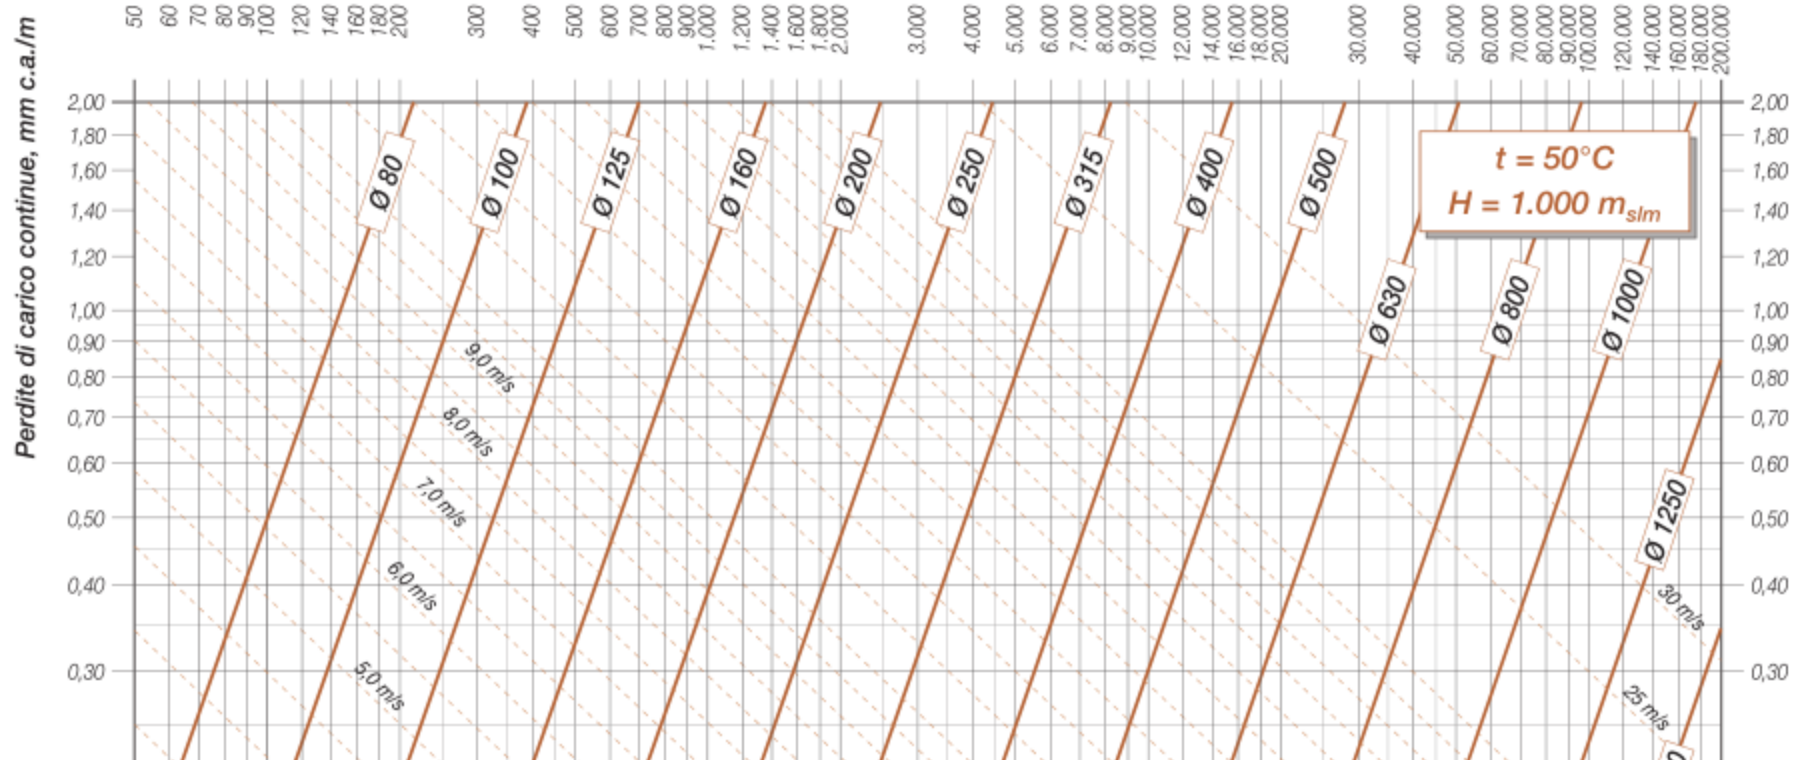

- r = length specific pressure losses (Pa/m)
- Fa = Friction factor (dimensionless)
- ε = duct roughness (mm)
- ρ = flue gas density (kg/m³)
- G = flue gas flowrate (m³/h)
- D = duct inner diameter (mm)

$$r = 0,6376 * 10^7 * F_a * \rho * \frac{G^2}{D^5}$$

- r = length specific pressure losses (mmH₂O/m)
- Fa = Friction factor (dimensionless)
- ε = duct roughness (mm)
- ρ = flue gas density (kg/m³)
- G = flue gas flowrate (m³/h)
- D = duct inner diameter (mm)

CONTINUOUS HEAD LOSSES – TURBULENT FLOW – REFERENCE TABLES

Perdite di carico continue dell'aria – CONDOTTI CIRCOLARI "MOLTO LISCI" – $t = 50^{\circ}\text{C}$, $H = 1.000\text{ m}_{slm}$

LOCALIZED HEAD LOSSES

$$r = \xi * \rho * \frac{v^2}{2}$$

- r = pressure losses (Pa)
- ξ = localized head loss coefficient (dimensionless)
- ρ = flue gas density (kg/m³)
- v = flue gas velocity (m/s)

$$r = \xi * \rho * \frac{v^2}{2 * 9,81}$$

- r = pressure losses (mmH₂O)
- ξ = localized head loss coefficient (dimensionless)
- ρ = flue gas density (kg/m³)
- v = flue gas velocity (m/s)

The ξ coefficient depends on the «shape» of the singularity (bends, Y junction, contraction); It can be determined by:

- Specific formulas (in cases of simple geometry)
- Laboratory tests
- **Tables!**
